

- **Json** {"name":"Gunther","planet":"Earth","age":54}
- **Object** {name:"Gunther",planet:"Earth",age:54}
- JavaScript provides two methods for working with JSON. The first is JSON.stringify and the second is JSON.parse.  
**JSON.stringify** converts a JavaScript object into a JSON string,  
**JSON.parse** converts a JSON string into a JavaScript object

## Yargs notes app

AddNote:- Add new note, check duplicate title

DeleteNote:- Delete note using title

Create another file note.js

Add functions addNote / removeNote

Then we used module.exports to be able to use them in app.js file

In app.js file we require our note.js and we accessed the functions in the handler
